ABSTRACT OF THE DISCLOSURE

A control point server includes a CP stack module for sending a search message to the devices connected to a home network and parsing a response message received from a home network device; a description module for requesting a description of the device connected to the home network based on the parsed information transmitted from the CP stack module; and a component generation module for organizing a component, which describes the services of the device connected to the home network, based on the description requested by the description module. Accordingly, discovery and description processes for devices on a home network are managed by the control point server, and thus, efficient access to the devices on the home network is gained.
